

Table of Contents

Introduction	xxviii
Preface	xxxix
Author's Biographies	xxxviii
Keith J Laidler , University of Ottawa	xxxviii
John H. Meiser , Ball State University	xxxix
Bryan Clifford Sanctuary , McGill University	xl
Periodic Table	
 Chapter 1 The Nature of Physical Chemistry and the Kinetic Theory of Gases	 1-1
Preview	1-2
Objectives	1-4
1.1. The Nature of Physical Chemistry	1-5
1.2. Some Concepts from Classical Mechanics	1-7
Work	1-7
Kinetic and Potential Energy	1-9
1.3. Systems, States, and Equilibrium	1-12
1.4. Thermal Equilibrium	1-14
The Concept of Temperature and Its Measurement	1-14
1.5. Pressure and Boyle's Law	1-16
1.6. Gay-Lussac's (Charles's) Law	1-22
1.7. The Ideal Gas Thermometer	1-25
1.8. The Equation of State for an Ideal Gas	1-27
The Gas Constant and the Mole Concept	1-27

1.9. The Kinetic-Molecular Theory of Ideal Gases	1-30
The Pressure of a Gas Derived from Kinetic Theory	1-32
Kinetic Energy and Temperature	1-34
Dalton's Law of Partial Pressures	1-36
Graham's Law of Effusion	1-39
Molecular Collisions	1-40
1.10. The Barometric Distribution Law	1-47
1.11. The Maxwell Distribution of Molecular Speeds and Translational Energies	1-51
The Distribution of Speeds	1-51
The Distribution of Translational Energy	1-56
1.12. Real Gases	1-58
The Compression Factor	1-58
Condensation of Gases: The Critical Point	1-60
Uses of Supercritical Fluids	1-65
1.13. Equations of State	1-67
The van der Waals Equation of State	1-67
The Law of Corresponding States	1-70
Other Equations of State	1-74
1.14. The Virial Equation	1-75
Appendix: Some Definite and Indefinite Integrals Often Used in Physical Chemistry	1-79
Key Equations	1-80
Problems	1-83
Suggested Reading	1-92
Biography : Robert Boyle	1-93
 Chapter 2 The First Law of Thermodynamics	 2-1
 Preview	 2-2
Objectives	2-3
2.1. Origins of the First Law	2-4

2.2.	States and State Functions.	2-6
2.3.	Equilibrium States and Reversibility	2-8
2.4.	Energy, Heat, and Work.	2-10
	The Nature of Work	2-13
	Processes at Constant Volume	2-19
	Processes at Constant Pressure: Enthalpy	2-19
	Heat Capacity	2-21
2.5.	Thermochemistry	2-24
	Extent of Reaction	2-24
	Standard States	2-26
	Measurement of Enthalpy Changes	2-28
	Calorimetry	2-31
	Relationship between ΔU and ΔH	2-33
	Temperature Dependence of Enthalpies of Reaction	2-34
	Enthalpies of Formation	2-38
	Bond Enthalpies	2-42
2.6.	Ideal Gas Relationships	2-45
	Reversible Compression at Constant Pressure	2-45
	Reversible Pressure Change at Constant Volume	2-48
	Reversible Isothermal Compression	2-49
	Reversible Adiabatic Compression	2-52
2.7.	Real Gases	2-55
	The Joule-Thomson Experiment	2-55
	Van der Waals Gases	2-60
	Key Equations	2-63
	Problems	2-64
	Suggested Reading	2-77

Chapter 3	The Second and Third Laws of Thermodynamics	3-1
Preview		3-2
Objectives		3-4
3.1.	The Carnot Cycle	3-8
	Efficiency of a Reversible Carnot Engine	3-15
	Carnot's Theorem	3-17
	The Thermodynamic Scale of Temperature	3-19
	The Generalized Cycle: The Concept of Entropy	3-20
3.2.	Irreversible Processes	3-23
3.3.	Molecular Interpretation of Entropy	3-28
3.4.	The Calculation of Entropy Changes	3-32
	Changes of State of Aggregation	3-32
	Ideal Gases	3-34
	Entropy of Mixing	3-37
	Informational or Configurational Entropy	3-39
	Solids and Liquids	3-40
3.5.	The Third Law of Thermodynamics	3-46
	Cryogenics: The Approach to Absolute Zero	3-46
	Entropy changes become zero at the absolute zero.	3-46
	Absolute Entropies	3-49
3.6.	Conditions for Equilibrium	3-51
	Constant Temperature and Pressure: The Gibbs Energy	3-53
	Constant Temperature and Volume: The Helmholtz Energy	3-55
3.7.	The Gibbs Energy	3-56
	Molecular Interpretation	3-56
	Gibbs Energies of Formation	3-60
	Gibbs Energy and Reversible Work	3-61
3.8.	Some Thermodynamic Relationships	3-64
	Maxwell Relations	3-64
	Thermodynamic Equations of State	3-68

Some Applications of the Thermodynamic Relationships	3-68
Fugacity and Activity	3-71
3.9. The Gibbs-Helmholtz Equation	3-78
3.10. Thermodynamic Limitations to Energy Conversion	3-80
First Law Efficiencies	3-80
Second Law Efficiencies	3-80
Refrigeration and Liquefaction	3-83
Heat Pumps	3-85
Chemical Conversion	3-87
Key Equations	3-90
Problems	3-92
Suggested Reading	3-106
Biography: Rudolf Julius Emmanuel Clausius	3-107
 Chapter 4 Chemical Equilibrium	 4-1
Preview	4-2
Objectives	4-3
4.1. Chemical Equilibrium Involving Ideal Gases	4-7
Equilibrium Constant in Concentration Units	4-11
Units of the Equilibrium Constant	4-14
4.2. Equilibrium in Nonideal Gaseous Systems	4-21
4.3. Chemical Equilibrium in Solution	4-22
4.4. Heterogeneous Equilibrium	4-25
4.5. Tests for Chemical Equilibrium	4-28
4.6. Shifts of Equilibrium at Constant Temperature	4-30
4.7. Coupling of Reactions	4-33

4.8. Temperature Dependence of Equilibrium Constants	4-38
4.9. Pressure Dependence of Equilibrium Constants	4-45
Key Equations	4-49
Problems	4-50
Suggested Reading	4-66
Biography: Jacobus Henricus Van't Hoff	4-67
 Chapter 5 Phases and Solutions	 5-1
Preview	5-2
Objectives	5-4
5.1. Phase Recognition	5-5
Phase Distinctions in the Water System	5-6
Phase Changes in Liquid Crystals	5-7
Phase Equilibria in a One-Component System: Water	5-8
5.2. Vaporization and Vapor Pressure	5-14
The Clausius-Clapeyron Equation	5-15
Enthalpy and Entropy of Vaporization: Trouton's Rule	5-20
Variation of Vapor Pressure with External Pressure	5-24
5.3. Classification of Transitions in Single-Component Systems	5-27
5.4. Ideal Solutions: Raoult's and Henry's Laws	5-31
5.5. Partial Molar Quantities	5-39
Relation of Partial Molar Quantities to Normal Thermodynamic Properties ²	5-42
5.6. The Chemical Potential	5-46
5.7. Thermodynamics of Solutions	5-50
Raoult's Law Revisited	5-50
Ideal Solutions	5-53
Nonideal Solutions; Activity and Activity Coefficients	5-59

5.8. The Colligative Properties	5-63
Freezing Point Depression	5-63
Ideal Solubility and the Freezing Point Depression	5-70
Boiling Point Elevation	5-72
Osmotic Pressure	5-73
Key Equations	5-79
Problems	5-81
Suggested Reading	5-90
 Chapter 6 Phase Equilibria	 6-1
Preview	6-2
Objectives	6-3
6.1. Equilibrium Between Phases	6-4
Number of Components	6-4
Degrees of Freedom	6-7
The Phase Rule	6-7
6.2. One-Component Systems	6-10
6.3. Binary Systems Involving Vapor	6-13
Liquid-Vapor Equilibria of Two-Component Systems	6-13
Liquid-Vapor Equilibrium in Systems Not Obeying Raoult's Law	6-19
Temperature-Composition Diagrams: Boiling Point Curves	6-21
Distillation	6-24
Azeotropes	6-28
Distillation of Immiscible Liquids: Steam Distillation	6-31
Distillation of Partially Miscible Liquids	6-34
6.4. Condensed Binary Systems	6-36
Two-Liquid Components	6-36
Solid-Liquid Equilibrium: Simple Eutectic Phase Diagrams	6-41
6.5. Thermal Analysis	6-43

6.6. More Complicated Binary Systems	6-45
Solid Solutions	6-47
Partial Miscibility	6-49
Compound Formation	6-51
6.7. Crystal Solubility: The Krafft Boundary and Krafft Eutectic	6-55
6.8. Ternary Systems	6-58
Liquid-Liquid Ternary Equilibrium	6-60
Solid-Liquid Equilibrium in Three-Component Systems	6-62
Representation of Temperature in Ternary Systems	6-66
Key Equations	6-69
Problems	6-70
Suggested Reading	6-83
 Chapter 7 Solutions of Electrolytes	 7-1
Preview	7-2
Objectives	7-4
7.1. Faraday's Laws of Electrolysis	7-8
7.2. Molar Conductivity	7-12
7.3. Weak Electrolytes: The Arrhenius Theory	7-16
Ostwald's Dilution Law	7-18
7.4. Strong Electrolytes	7-20
Debye-Hückel Theory	7-21
The Ionic Atmosphere	7-22
Mechanism of Conductivity	7-32
Ion Association	7-36
Conductivity at High Frequencies and Potentials	7-38
7.5. Independent Migration of Ions	7-40
Ionic Mobilities	7-41

7.6. Transport Numbers	7-44
Hittorf Method	7-47
Moving Boundary Method	7-50
7.7. Ion Conductivities	7-52
Ionic Solvation	7-54
Mobilities of Hydrogen and Hydroxide Ions	7-54
Ionic Mobilities and Diffusion Coefficients	7-56
Walden's Rule	7-57
7.8. Thermodynamics of Ions	7-58
7.9. Theories of Ions in Solution	7-61
Drude and Nernst's Electrostriction Model	7-61
Born's Model	7-62
More Advanced Theories	7-65
Qualitative Treatments	7-67
7.10. Activity Coefficients	7-72
Debye-Hückel Limiting Law	7-72
Deviations from the Debye-Hückel Limiting Law	7-76
Activity Coefficients from Equilibrium Constant Measurements	7-79
7.11. Ionic Equilibria	7-79
Solubility Products	7-81
7.12. Ionization of Water	7-86
7.13. The Donnan Equilibrium	7-88
Key Equations	7-92
Problems	7-94
Suggested Reading	7-103
Biography: Michael Faraday	7-104
Biography: Svante August Arrhenius	7-105

Chapter 8	Electrochemical Cells	8-1
Preview		8-2
Objectives		8-3
8.1.	The Daniell Cell	8-4
8.2.	Standard Electrode Potentials	8-8
	The Standard Hydrogen Electrode	8-8
	Other Standard Electrodes	8-15
	Ion-Selective Electrodes	8-17
8.3.	Thermodynamics of Electrochemical Cells	8-20
	The Nernst Equation	8-28
	Nernst Potentials	8-32
	Temperature Coefficients of Cell emfs	8-38
8.4.	Types of Electrochemical Cells	8-40
	Concentration Cells	8-41
	Redox Cells	8-43
8.5.	Applications of emf Measurements	8-48
	pH Determinations	8-48
	Activity Coefficients	8-48
	Equilibrium Constants	8-51
	Solubility Products	8-53
	Potentiometric Titrations	8-55
8.6.	Fuel Cells	8-57
8.7.	Photogalvanic Cells	8-60
8.8.	Batteries, Old and New	8-63
	The Original and Modified Leclanché Cell	8-65
	Alkaline Manganese Cells	8-66
	Zinc–Mercuric Oxide and Zinc–Silver Oxide Batteries	8-67
	Metal-Air Batteries	8-68
	Nickel-Cadmium (Ni-cad) Secondary Battery	8-69
	The Lead-Acid Storage Battery	8-69
	Lithium Ion Batteries	8-70

Key Equations	8-76
Problems	8-77
Suggested Reading	8-88
Chapter 9 Chemical Kinetics I. The Basic Ideas	9-1
Preview	9-2
Objectives	9-4
9.1. Rates of Consumption and Formation	9-5
9.2. Rate of Reaction	9-7
9.3. Empirical Rate Equations	9-8
Order of Reaction	9-8
Reactions Having No Order	9-10
Rate Constants and Rate Coefficients	9-11
9.4. Analysis of Kinetic Results	9-14
Method of Integration	9-15
Half-Life	9-20
Differential Method	9-23
Reactions Having No Simple Order	9-23
Opposing Reactions	9-24
9.5. Techniques for Very Fast Reactions	9-26
Flow Methods	9-26
Pulse Methods	9-29
9.6. Molecular Kinetics	9-34
Molecularity and Order	9-34
9.7. The Arrhenius Equation.	9-36
Activation Energy	9-41
9.8. Potential-Energy Surfaces	9-47
9.9. The Pre-exponential Factor	9-52
Hard-Sphere Collision Theory	9-52

Transition-State Theory	9-55
Quantum-Mechanical Tunneling	9-62
Kinetic-Isotope Effects	9-65
9.10. Reactions in Solution	9-67
Influence of Solvent Dielectric Constant	9-68
Influence of Ionic Strength	9-75
Influence of Hydrostatic Pressure	9-78
Diffusion-Controlled Reactions	9-82
Linear Gibbs Energy Relationships	9-82
Molecular Beams	9-85
9.11. Reaction Dynamics	9-85
Chemiluminescence	9-88
Dynamical Calculations	9-89
The Detection of Transition Species	9-90
Key Equations	9-92
Problems	9-93
Suggested Reading	9-108
Biography: Henry Eyring	9-110
 Chapter 10 Chemical Kinetics II. Composite Mechanisms	 10-1
Preview	10-2
Objectives	10-3
10.1. Evidence for a Composite Mechanism	10-9
10.2. Types of Composite Reactions	10-11
10.3. Rate Equations for Composite Mechanisms	10-12
Consecutive Reactions	10-13
Steady-State Treatment	10-16
Rate-Controlling (Rate-Determining) Steps	10-18
10.4. Rate Constants, Rate Coefficients, and Equilibrium Constants	10-24

10.5. Free-Radical Reactions	10-27
Chain Reactions	10-28
Organic Decompositions	10-31
10.6. Photochemical Reactions	10-37
The Photochemical Hydrogen-Chlorine Reaction	10-41
The Photochemical Hydrogen-Bromine Reaction	10-42
Photosensitization	10-44
Flash Photolysis	10-45
10.7. Radiation-Chemical Reactions	10-47
10.8. Explosions	10-51
The Initiation of an Explosion	10-52
The Transmission of an Explosion	10-53
Detonations	10-54
Explosion Limits in Gaseous Explosions	10-55
Cool Flames	10-57
10.9. Catalysis	10-58
Acid-Base Catalysis	10-61
Brønsted Relationships	10-65
Enzyme Catalysis	10-67
10.10. Reactions in Solution: Some Special Features	10-76
Collisions and Encounters	10-76
10.11. Mechanisms of Macromolecule Formation	10-79
Introduction	10-79
Addition Polymers	10-80
Step-Growth Polymerization	10-81
Ionic Polymerizations	10-81
“Living” Polymers	10-83
Heterogeneous Polymerization	10-83
Emulsion Polymerization	10-85
10.12. Kinetics of Polymerization	10-86
Free-Radical Polymerization	10-86
Condensation Polymerization	10-89

10.13. Induction Periods, Oscillations, and Chaos	10-91
Clock Reactions	10-92
Oscillating Reactions	10-93
Cool Flames	10-94
The Belousov-Zhabotinsky Reaction	10-96
Chaos in Chemical Reactions	10-103
Kinetics of Electrode Reactions	10-105
10.14. Electrochemical Dynamics	10-105
Polarography	10-113
Electrokinetic Effects: The Electric Double Layer	10-115
Electroosmosis	10-118
Electrophoresis	10-120
Reverse Isoelectric Effects	10-122
Problems	10-123
Suggested Reading	10-139
 Chapter 11 Quantum Mechanics and Atomic Structure	 11-1
Preview	11-2
Objectives	11-4
11.1. Electromagnetic Radiation and the Old Quantum Theory	11-5
Simple Harmonic Motion	11-8
Hooke	11-11
Plane Waves and Standing Waves	11-13
Blackbody Radiation	11-17
Einstein and the Quantization of Radiation	11-25
Zero-Point Energy	11-27
11.2. Bohr's Atomic Theory	11-28
Spectral Series	11-31
11.3. The Foundations of Quantum Mechanics	11-35
The Wave Nature of Electrons	11-35
The Uncertainty Principle	11-39

11.4. Schrödinger's Wave Mechanics	11-42
Eigenfunctions and Normalization	11-46
11.5. Quantum-Mechanical Postulates	11-50
Orthogonality of Wave Functions	11-55
Non-Commutation and the Heisenberg Uncertainty Principle	11-58
11.6. Quantum Mechanics of Some Simple Systems	11-61
The Free Particle	11-61
The Particle in a Box	11-63
The Harmonic Oscillator	11-70
11.7. Quantum Mechanics of Hydrogenlike Atoms	11-75
Solution of the Φ Equation	11-78
Solution of the Θ Equation	11-81
Solution of the R Equation	11-82
Complete Wave Functions	11-84
11.8. Physical Significance of the Orbital Quantum Numbers	11-88
The Principal Quantum Number n	11-88
Angular Dependence of the Wave Function: The Quantum Numbers l and m_l	11-93
11.9. Angular Momentum and Magnetic Moment	11-96
Angular Momentum	11-96
Magnetic Moment	11-100
11.10. The Rigid Linear Rotor	11-103
11.11. Spin Quantum Numbers	11-105
11.12. Many-Electron Atoms	11-108
The Pauli Exclusion Principle	11-108
The Aufbau Principle	11-112
Hund's Rule	11-114
11.13. Approximation Methods in Quantum Mechanics	11-116
The Variation Method	11-119
Perturbation Method	11-121
The Self-Consistent Field (SCF) Method	11-123
Slater Orbitals	11-124

Relativistic Effects in Quantum Mechanics	11-126
Dirac Notation	11-126
Key Equations	11-129
Problems	11-133
Suggested Reading	11-143
 Chapter 12 The Chemical Bond	 12-1
Preview	12-2
Objectives	12-4
The Nature of the Covalent Bond	12-5
12.1. The Hydrogen Molecular-Ion, H_2^+	12-9
12.2. The Hydrogen Molecule	12-15
The Heitler-London Valence-Bond Method	12-15
Electron Spin	12-24
The Molecular-Orbital Method	12-26
12.3. Hückel Theory for More Complex Molecules	12-34
Ethene (Ethylene)	12-37
Butadiene	12-38
Benzene	12-43
12.4. Valence-Bond Theory for More Complex Molecules	12-45
The Covalent Bond	12-45
Electronegativity	12-46
Orbital Overlap	12-51
Orbital Hybridization	12-53
Multiple Bonds	12-59
12.5. Symmetry in Chemistry	12-62
Symmetry Elements and Symmetry Operations	12-62
Point Groups and Multiplication Tables	12-69
Group Theory	12-77

12.6. Symmetry of Molecular Orbitals	12-83
Homonuclear Diatomic Molecules	12-83
The Weakest Known Bond: The Helium Dimer	12-92
Heteronuclear Diatomic Molecules	12-95
The Water Molecule	12-97
Key Equations	12-102
Problems	12-104
Suggested Reading	12-109
Biography: Gilbert Newton Lewis	12-111
 Chapter 13 Foundations of Chemical Spectroscopy	 13-1
Preview	13-2
Objectives	13-3
13.1. Emission and Absorption Spectra	13-4
Classical Electromagnetic Waves	13-5
The Energy of Radiation in Emission and Absorption	13-6
Time-Dependent Perturbation Theory and Spectral Transitions	13-8
The Einstein Coefficients	13-14
The Laws of Lambert and Beer	13-19
13.2. Atomic Spectra	13-23
Coulombic Interaction and Term Symbols	13-23
Exchange Interaction: Multiplicity of States	13-27
Spin-Orbit Interactions	13-32
The Vector Model of the Atom	13-35
The Effect of an External Magnetic Field	13-39
13.3. Pure Rotational Spectra of Molecules	13-49
Diatomic Molecules	13-51
Linear Triatomic Molecules	13-58
Microwave Spectroscopy	13-60
Nonlinear Molecules	13-61
The Stark Effect	13-64

13.4. Vibrational-Rotational Spectra of Molecules.	13-65
Diatomic Molecules	13-65
Coupling of Rotational and Vibrational Motion: The Separability Assumption	13-78
Normal Modes of Vibration	13-80
Infrared Spectra of Complex Molecules	13-85
Characteristic Group Frequencies	13-88
13.5. Raman Spectra	13-92
13.6. Electronic Spectra of Molecules	13-99
Term Symbols for Linear Molecules	13-100
Selection Rules	13-105
The Structure of Electronic Band Systems	13-110
Excited Electronic States	13-114
The Fate of Electronically Excited Species	13-120
Appendix: Symmetry Species Corresponding to Infrared and Raman Spectra	13-126
Key Equations	13-127
Problems	13-130
Suggested Reading	13-140
Biography: Gerhard Herzberg	13-141
 Chapter 14 Some Modern Applications of Spectroscopy	 14-1
Preview	14-2
Objectives	14-3
14.1. The Donnan Equilibrium	14-7
Requirements for Stimulated Emission	14-7
Properties of Laser Light	14-10
Three- and Four-Level Lasers	14-12
14.2. Spectral Line Widths	14-15
Lifetime Broadening	14-15
Doppler Broadening	14-16

14.3. Types of Lasers	14-18
14.4. Laser Techniques for Chemistry	14-25
The Use of Lasers in Chemical Spectroscopy	14-29
Laser Raman Spectroscopy	14-31
Hyper-Raman Spectroscopy	14-32
Resonance Raman Spectroscopy	14-33
Coherent Anti-Stokes Raman Scattering (CARS)	14-35
Laser-Induced Fluorescence (LIF)	14-35
Zero Kinetic Energy Raman Spectroscopy (ZEKE)	14-37
Application of Lasers to Other Branches of Spectroscopy	14-37
14.5. Magnetic Spectroscopy	14-40
Magnetic Susceptibility	14-40
Magnetic and Electric Moments	14-41
Magnetic Interaction Leading to Spectra Consequences	14-45
14.6. Nuclear Magnetic Resonance Spectroscopy	14-49
The Machinery of NMR Spectroscopy	14-53
Pulsed NMR	14-53
Spin Echoes	14-56
NMR Instrumentation	14-60
One-Dimensional NMR Experiments	14-61
Chemical Shifts	14-62
J-coupling	14-65
Two Coupled Spins	14-65
Classification of Spectra	14-70
Two-Dimensional NMR	14-72
Examples of the Use of NMR in Chemistry	14-81
Solid-State NMR	14-82
14.7. Electron Magnetic Resonance (EMR)	14-84
Hyperfine Structure	14-87
14.8. Mössbauer Spectroscopy	14-93
14.9. Photoelectron Spectroscopy	14-96
14.10. Photoacoustic Spectroscopy	14-100

14.11. Chiroptical Methods.	14-101
The Nature of Polarized Light	14-101
Optical Activity and Polarimetry	14-103
Optical Rotatory Dispersion (ORD)	14-108
Circular Dichroism (CD)	14-109
14.12. Mass Spectrometry.	14-111
Key Equations	14-115
Problems	14-117
Suggested Reading	14-120
 Chapter 15 Statistical Mechanics	 15-1
Preview	15-2
Objectives	15-4
15.1. Introduction and Historical Background	15-5
Maxell's Demon	15-5
Forms of Molecular Energy	15-6
Molar Heat Capacities of Gases: Classical Interpretations	15-7
Molar Heat Capacities of Gases: Quantum Restrictions	15-10
Introduction to statistical mechanics	15-10
The Ensemble Concept	15-13
The Fundamental Postulate of Statistical Mechanics (equal <i>a priori</i> (beforehand) probabilities):	15-14
Ensemble averaging:	15-15
15.2. Probability and Entropy	15-22
The statistical entropy of a physical system:	15-25
Entropy for the Expansion of a Perfect Gas.	15-26
Corrected Boltzmann statistics.	15-30
Particle indistinguishability	15-33
Fermi-Dirac statistics:	15-37
Bose-Einstein statistics:	15-37
Maxwell-Boltzmann statistics:	15-37

The Most Probable Molecular Distribution.	15-38
The Second Law of Thermodynamics from Statistical Mechanics	15-42
15.3. Boltzmann factor and the partition function	15-44
The molecular Partition Function	15-49
Energy and Entropy	15-52
15.4. The Boltzmann Distribution and quantum statistics	15-55
Maxwell-Boltzmann statistics	15-61
Quantum statistics	15-62
The Most Probable Distribution (using the method of Lagrange Multipliers).	15-64
Identification of α and β .	15-69
15.5. Equilibrium Statistical Thermodynamics.	15-71
Natural Variables and the Legendre Transformation.	15-75
Legendre transformation for thermodynamic functions.	15-78
Legendre transformations of the entropy and different ensembles.	15-80
Canonical ensemble:	15-81
Grand Canonical ensemble	15-83
Non-interacting particles.	15-84
Quantum gases	15-86
15.6. Thermodynamic Quantities from Other Partition Functions	15-91
Residual Entropies	15-93
15.7. The Partition Function for Some Special Cases	15-95
Translational Motion	15-95
Rotational Motion	15-99
Vibrational Motion	15-102
The Electronic Partition Function	15-108
The Nuclear Partition Function	15-110
15.8. The Calculation of Equilibrium Constants.	15-111
Direct Calculation from Partition Functions	15-113
15.9. Transition-State Theory	15-122
The Assumption of "Quasi-Equilibrium"	15-123
Derivation of the Transition-State Theory Equation	15-125
Thermodynamic Formulation of Transition-State Theory	15-131
Extensions of Transition-State Theory	15-132

Key Equations	15-134
Appendix	15-138
Problems	15-141
Suggested Reading	15-154
Biography: Ludwig Boltzmann	15-155
 Chapter 16 The Solid State	 16-1
Preview	16-2
Objectives	16-3
16.1. Crystal Forms and Crystal Lattices	16-4
The Unit Cell	16-7
Symmetry Properties	16-11
Point Groups and Crystal Systems	16-14
Space Lattices	16-14
Space Groups	16-17
Periodicity and the Reciprocal Lattice	16-17
Crystal Planes and Miller Indices	16-20
Indices of Direction	16-29
16.2. X-Ray Crystallography	16-31
The Origin of X Rays	16-31
The Bragg Equation	16-34
X-Ray Scattering	16-38
Elastic Scattering, Fourier Analysis, and the Structure Factor	16-42
16.3. Experimental Methods and Applications	16-46
The Laue Method	16-46
The Powder Method	16-47
Rotating Crystal Methods	16-49
X-Ray Diffraction	16-51
Electron Diffraction	16-53
Neutron Diffraction	16-54
Interpretation of X-Ray Diffraction Patterns	16-56

Structure Factor: Simple Cubic (sc) Lattice	16-57
Structure Factor: Body-Centered (bc) Lattice	16-57
Structure Factor: Face-Centered Cubic (fcc) Lattice	16-58
Bonding in Solids	16-61
16.4. Theories of Solids	16-61
Ionic, Covalent, and van der Waals Radii	16-63
Binding Energy of Ionic Crystals	16-63
The Born-Haber Cycle	16-66
The Structure of Metals: The Closest Packing of Spheres	16-69
Metallic Radii	16-72
16.5. Statistical Thermodynamics of Crystals: Theories of Heat Capacities.	16-73
The Einstein Model	16-74
The Debye Model	16-76
Fermi-Dirac Statistics	16-78
Visualization of the Quantum Statistics Function	16-79
Quantum Statistics	16-82
Determination of the Fermi Energy	16-85
16.6. Electrical Conductivity in Solids	16-91
Metals: The Free-Electron Theory	16-92
Metals, Semiconductors, and Insulators: Band Theory	16-94
<p>p-n Junction</p>	16-103
Superconductivity	16-104
Transition Metal Impurities and Charge Transfer	16-109
16.7. Optical Properties of Solids	16-109
Color and Luster in Metals	16-110
Color Centers: Non-stoichiometric Compounds	16-110
Luminescence in Solids	16-111
Key Equations	16-112
Problems	16-115
Suggested Reading	16-122
Biography: Dorothy Crowfoot Hodgkin	16-125

Chapter 17 The Liquid State	17-1
Preview	17-2
Objectives	17-3
17.1. Liquids Compared with Dense Gases	17-5
Internal Pressure	17-6
Internal Energy	17-8
17.2. Liquids Compared with Solids	17-13
X-Ray Diffraction	17-16
Neutron Diffraction	17-18
Glasses	17-18
17.3. Intermolecular Forces	17-19
Ion-Ion Forces	17-21
Ion-Dipole Forces	17-22
Dipole-Dipole Forces	17-24
Hydrogen Bonds	17-26
Dispersion Forces	17-26
Repulsive Forces	17-27
Resultant Intermolecular Energies	17-28
17.4. Theories and Models of Liquids	17-30
Free-Volume or Cell Theories	17-30
Hole or "Significant Structure" Theories	17-35
Partition Functions for Liquids	17-35
Computer Simulation of Liquid Behavior	17-36
17.5. Water, The Incomparable Liquid	17-38
Experimental Investigations of Water Structure	17-39
Intermolecular Energies in Water	17-40
Models of Liquid Water	17-41
Computer Simulation of Water Structure	17-42
17.6. The Hydrophobic Effect	17-43
Key Equations	17-45
Problems	17-47

Suggested Reading	17-51
Chapter 18 Surface Chemistry and Colloids	18-1
Preview	18-2
Objectives	18-3
18.1. Adsorption	18-5
18.2. Adsorption Isotherms	18-7
The Langmuir Isotherm	18-7
Adsorption with Dissociation	18-10
Competitive Adsorption	18-11
Other Isotherms	18-13
18.3. Thermodynamics and Statistical Mechanics of Adsorption	18-15
18.4. Chemical Reactions on Surfaces	18-18
Unimolecular Reactions	18-18
Bimolecular Reactions	18-20
18.5. Surface Heterogeneity	18-24
18.6. The Structure of Solid Surfaces and of Adsorbed Layers	18-26
Photoelectron Spectroscopy (XPS and UPS)	18-26
Field-Ion Microscopy (FIM)	18-27
Auger Electron Spectroscopy (AES)	18-29
Low-Energy Electron Diffraction (LEED)	18-29
Scanning Tunneling Microscopy (STM)	18-31
Details of the Solid Surface	18-32
18.7. Surface Tension and Capillarity	18-34
18.8. Liquid Films on Surfaces	18-40
18.9. Colloidal Systems	18-44
Lyophobic and Lyophilic Sols	18-45
Light Scattering by Colloidal Particles	18-46
Electrical Properties of Colloidal Systems	18-48
Gels	18-51

Emulsions	18-53
Key Equations	18-54
Problems	18-55
Suggested Reading	18-62
Biography: Agnes Pockels	18-64
 Chapter 19 Transport Properties	 19-1
Preview	19-2
Objectives	19-3
19.1. Viscosity	19-5
Measurement of Viscosity	19-5
Viscosities of Gases	19-9
Viscosities of Liquids	19-13
Viscosities of Solutions	19-18
19.2. Diffusion	19-21
Fick's Laws	19-21
Solutions of Diffusion Equations	19-23
Brownian Movement	19-27
Self-Diffusion of Gases	19-31
Driving Force of Diffusion	19-33
Diffusion and Ionic Mobility	19-36
Stokes's Law	19-38
Perrin's Experiments on Brownian Movement	19-40
Diffusion through Membranes	19-40
19.3. Sedimentation	19-44
Sedimentation Velocity	19-44
Sedimentation Equilibrium	19-49
Key Equations	19-52
Problems	19-55
Suggested Reading	19-61
